EXPERIMENT 3: INFORMATION RETRIEVAL USING spaCy

AIM:

To implement an information retrieval system using spaCy and TF-IDF by preprocessing text, removing stop words, analyzing part-of-speech tags, and retrieving the most relevant documents for a user query using cosine similarity.

ALGORITHM:

1. Import spaCy, Pandas, fetch_20newsgroups, TfidfVectorizer, and cosine_similarity.
2. Load the 20 Newsgroups dataset and select the first 500 documents, excluding headers, footers, and quoted text.
3. Define a preprocessing function to convert text to lowercase, tokenize it with spaCy, remove stop words and non-alphabetic tokens, and use lemmas.
4. Store the original text and preprocessed text in a Pandas DataFrame.
5. Extract stop words from the documents using spaCy and display sample results.
6. Print part-of-speech tags for tokens in the first three documents.
7. Convert the cleaned documents into TF-IDF vectors using TfidfVectorizer.
8. Enter the query “NASA space launch” and preprocess it using the same text-preprocessing function.
9. Transform the query into a TF-IDF vector and calculate cosine similarity between the query and all documents.
10. Sort the similarity scores and display the top five most relevant documents.

```python
#MUTHURAJ_R_241801176
# EXP 3 Information Retrieval using spaCy

import spacy
import pandas as pd
from sklearn.datasets import fetch_20newsgroups
from sklearn.feature_extraction.text import TfidfVectorizer
from sklearn.metrics.pairwise import cosine_similarity

nlp = spacy.load("en_core_web_sm")
newsgroups = fetch_20newsgroups(
    subset="all",
    remove=("headers", "footers", "quotes")
)
documents = newsgroups.data[:500]

def preprocess(text):
    doc = nlp(text.lower())
    words = []
    for token in doc:
        if token.is_alpha and not token.is_stop:
            words.append(token.lemma_)
    return " ".join(words)

df = pd.DataFrame({"Text": documents})
df["clean_text"] = df["Text"].apply(preprocess)

def get_stop_words(text):
    doc = nlp(text.lower())
    words = []
    for token in doc:
        if token.is_stop and token.is_alpha:
            words.append(token.lemma_)
    return " ".join(words)

df["stop_words"] = df["Text"].apply(get_stop_words)
print(df["stop_words"].head())
```

```python
#MUTHURAJ_R_241801176
# EXP 3 Information Retrieval using spaCy

for i, text in enumerate(df["Text"][:3]):
    print("\nDocument", i + 1, "POS Tags:")
    doc = nlp(text)
    for token in doc[:10]:
        print(token.text, token.pos_)

vectorizer = TfidfVectorizer()
tfidf = vectorizer.fit_transform(df["clean_text"])
query = "NASA space launch"
query = preprocess(query)
query_vector = vectorizer.transform([query])

similarity = cosine_similarity(query_vector, tfidf)
similarity = similarity.flatten()
top = similarity.argsort()[-5:][::-1]
print("\nTop 5 Relevant Documents:")

for i in top:
    print("\n", df["Text"].iloc[i][:300])
```

RESULT:

The information retrieval system using spaCy and TF-IDF was executed successfully. Text was preprocessed using tokenization, stop-word removal, and lemmatization; part-of-speech tags were displayed for sample documents. The query “NASA space launch” was compared with the document collection using cosine similarity, and the top five relevant documents were displayed.
